PATENT
Docket No. 39303.2009400
Client Reference H7119US
Serial No. 09/371,760

PROPOSED DRAFT AMENDMENT

1. A sound signal analyzing device comprising:
an input section that receives a sound signal to be analyzed;
a characteristic extraction section that extracts a characteristic of the sound signal as it is
received by said input section; and
a setting section that sets various parameters for use in analysis of said [the] sound signal
[received by said input section], in accordance with the characteristic of the sound signal
extracted by said characteristic extraction section,
wherein said characteristic extraction section extracts at least one of a volume level of the
sound signal and upper and lower pitch limits of the sound signal as said characteristic, and
wherein said setting section sets a threshold value for use in the analysis of the sound
signal, in accordance with the volume level of the sound signal extracted by said characteristic
extraction section, or said setting section sets a filter characteristic for use in the analysis of the
sound signal, in accordance with the upper and lower pitch limits extracted by said characteristic
extraction section.
